Yuhan Chi

School of Mathematical Sciences, Fudan University · chi-shan0707.github.io · github.com/Chi-Shan0707

Profile

- Undergraduate at Fudan University (School of Mathematical Sciences), pursuing a double degree in Information and Computing Science and Artificial Intelligence.
- GPA: 3.96/4.00 (most recent semester); ranked 10th (top 5%) in cohort.
- Research interests: mathematical interpretability for AI trust, verification/evaluation of LLM reasoning, and reinforcement learning for sequential decision-making.

Education

- Fudan University, Shanghai, China
  - B.S. Candidate in Information and Computing Science & Artificial Intelligence (Double Degree), School of Mathematical Sciences
  - Sep. 2025 – Present
  - GPA: 3.96/4.00 (most recent semester)
  - Rank: 10th (top 5%) in cohort

Research Interests

- Mathematical Interpretability and AI Trust: grounding claims about model reliability in inspectable mathematical and statistical evidence
- Reasoning Verification and Evaluation: studying when surface-level signals from LLM traces are diagnostic, misleading, or protocol-dependent
- Reinforcement Learning and Sequential Decision-Making: using RL concepts to reason about uncertainty, feedback, and interaction with environments

Selected Open-Source Projects

- token-verification-mirage (https://github.com/Chi-Shan0707/token-verification-mirage) — AI4Math Workshop (https://ai4math2026.github.io/)
  - Solo-author project; controlled evaluation of token-level verification signals for LLM math reasoning
  - Poster, ICML 2026 Workshop on AI for Math (AI4Math)
  - Audits how evaluation protocol choices such as pooling, in-sample scoring, and direction-agnostic AUROC can change apparent verification performance
  - Shows that shallow token statistics can be useful diagnostics, but should not be treated as stable standalone verifiers without stronger controls

- code-not-text (https://github.com/chi-shan0707/code-not-text) — Interactive Demo (https://chi-shan0707.github.io/code-not-text/demo)
  - Solo project; study of cross-domain behavior of hand-crafted CoT-surface features for predicting solution correctness from reasoning traces
  - Evaluated feature behavior across math, science, and coding settings, where the

  same feature family is strong for math but weak for coding
  - Interprets the gap as a measurement issue: coding correctness depends more directly on executable behavior than on text-level trace features
  - Includes an interactive demo and ablations around feature families and domain transfer

- TinyLoRA-GRPO-Coder (https://github.com/Chi-Shan0707/TinyLoRA-GRPO-Coder)
  - Solo project; independent reimplementation and adaptation inspired by *Learning to Reason in 13 Parameters*
  - Moved a small-parameter adaptation and GRPO-style training pipeline toward verifiable competitive-programming code generation on Qwen2.5-Coder-3B
  - Uses compile-and-run rewards rather than static heuristics
  - Built as a full research-system exercise: data processing, training, multi-GPU setup, reward design, evaluation, and validation

- microgpt.cpp (https://github.com/Chi-Shan0707/microgpt.cpp)
  - Solo project; minimal GPT implementation from first principles in C++, built to understand model internals without relying on high-level frameworks

Academic Service

- Reviewer, ICML 2026 Workshop on AI for Math (AI4Math) (https://ai4math2026.github.io/), 2026

Skills

- Programming: Python, C++, C, Java, Node.js, Lean 4
- ML/AI: PyTorch, ML experimentation, LLM evaluation, reinforcement-learning basics
- Tools: Git, GitHub, Linux, LaTeX, Markdown, VS Code
- Other: Mathematical proof writing, technical writing, self-directed learning, competitive programming

Additional Information

- Maintains github-unflag-playbook-cn (https://chi-shan0707.github.io/github-unflag-playbook-cn), a Chinese playbook documenting GitHub account flagging, recovery cases, and appeal workflows
- Contributor to FDUGuideBook/nav-site (https://github.com/FDUGuideBook/nav-site), a Fudan community site
- Personal website: chi-shan0707.github.io (https://chi-shan0707.github.io/)
- GitHub: Chi-Shan0707 (https://github.com/Chi-Shan0707)
- Actively self-studying mathematics, algorithms, and AI beyond formal coursework, with ongoing work documented in public repositories
